

Offline to Online RL Final Project

Setup

For general setup and Modal instructions, see 04-imitation-learning/README.md.

Examples

Here are some example commands. Run them in the 10-offline-to-online-rl-project directory.

- To run on a local machine:

```
uv run src/scripts/run.py --run_group=s1_sacbc --  
base_config=sacbc --env_name=cube-single-play-singletask-task1-v0  
--seed=0
```

- To run on Modal:

```
uv run modal run src/scripts/modal_run.py --run_group=s1_sacbc --  
base_config=sacbc --env_name=cube-single-play-singletask-task1-v0  
--seed=0
```

- You may request a different GPU type, CPU count, and memory size by changing variables in src/scripts/modal_run.py
- Use modal run --detach to keep your job running in the background.

- To run 4 jobs on a single GPU in parallel on Modal:

```
uv run modal run src/scripts/modal_run.py --njobs=4 \  
"JOB --run_group=s1_sacbc --base_config=sacbc --env_name=cube-  
single-play-singletask-task1-v0 --seed=0 --alpha=30" \  
"JOB --run_group=s1_sacbc --base_config=sacbc --env_name=cube-  
single-play-singletask-task1-v0 --seed=1 --alpha=100" \  
"JOB --run_group=s1_sacbc --base_config=sacbc --env_name=cube-  
single-play-singletask-task1-v0 --seed=2 --alpha=300" \  
"JOB --run_group=s1_sacbc --base_config=sacbc --env_name=cube-  
single-play-singletask-task1-v0 --seed=3 --alpha=1000"
```
